$$d_{E}^{2}\left(x,y
ight)=\sum_{k=1}^{MN}\left(x_{k}-y_{k}
ight)^{2},\quad x,y\in\mathbb{R}^{MN}$$

 Minimize graph energy subject to constraints (training set data).
 Conventional convolutional neural networks require Euclidean topology. The notion of distance in graphs can be abstract (manifolds).

- 70,000 grayscale 28 × 28 pixel handwritten digits 0 – 9.
- Construct k-nearest neighbor graph with weights of Euclidean distance between images (an example).

$$d_{E}^{2}\left(x,y
ight)=\sum_{k=1}^{MN}\left(x_{k}-y_{k}
ight)^{2},\quad x,y\in\mathbb{R}^{MN}$$

 Minimize graph energy (?) subject to constraints (training set data).
 Conventional convolutional neural networks require Euclidean topology. The notion of distance in graphs can be abstract (manifolds).

# Semi-Supervised Learning

Consider ordered pairs  $\{(x_i, y_i)\}_{i=1}^n \in \mathcal{X} \times \mathcal{Y}$ .

## Semi-Supervised Learning

Consider ordered pairs  $\{(x_i, y_i)\}_{i=1}^n \in \mathcal{X} \times \mathcal{Y}.$ 

 $\mathcal{X}$ : data, lives in  $\mathbb{R}^d$ .

 $\mathcal{Y}$ : labels (class), lives in  $\mathbb{R}^k$ , e.g., in the image classification problem, the label for an image showing digit 7 is the integer 7.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

It is wise to learn how "well-behaved" a random graph generated by sampled data is.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

It is wise to learn how "well-behaved" a random graph generated by sampled data is.

It is wise to learn how "well-behaved" a random graph generated by sampled data is.

#### Chebyshev's overkilling condition and bad tails

For i.i.d random variable  $X_i$  with finite common mean  $\mu$  and variance  $\sigma^2$ ,

$$S_n = \frac{1}{n} \sum_{i=1}^n X_i, \quad \mathbb{P}\left(|S_n - \mu_X| \ge t\right) \le \frac{\sigma^2}{nt^2}.$$

・ロト ・ 同 ・ ・ ヨ ・ ・ ヨ ・ うへつ

It is wise to learn how "well-behaved" a random graph generated by sampled data is.

### Chebyshev's overkilling condition and bad tails

For i.i.d random variable  $X_i$  with finite common mean  $\mu$  and variance  $\sigma^2$ ,

$$S_n = rac{1}{n}\sum_{i=1}^n X_i, \quad \mathbb{P}\left(|S_n - \mu_X| \ge t\right) \le rac{\sigma^2}{nt^2}.$$

## Hoeffding Inequality

For i.i.d random variables  $X_i$  with finite mean  $\mu$  such that  $|X - \mu| \le b$  for some positive *b*,

$$\mathbb{P}\left(|S_n - \mu_X| \ge t\right) \le 2 \exp\left(-\frac{nt^2}{2b^2}\right).$$

From discrete to continuous

From discrete to continuous

$$\mathcal{E}_{\epsilon,n,w}\left(u\right)=\frac{C_{\epsilon,n,w}}{2}u^{T}L_{w}u$$

$$E_{\delta}u(x)=\sum_{i=1}^{n}u(X_{i})\mathbf{1}_{U_{i}}(x),$$

#### Transportation Map $T_{\delta}$

Define  $T_{\delta}(x) = X_i$  iff  $x \in U_i$ . Then  $E_{\delta}u = u \circ T_{\delta}$ . If one considers an empirical measure  $\mu_n$  on  $A \subset U$ , then  $T_{\delta}$  pushes forward  $\rho_{\delta}$  to  $\mu_n$ .

## Take-aways

- Learn PDE
- Learn probability theory
- Learn calculus of variations if you want to prove convergence of new methods
- Graph-based methods don't restrict on underlying topology.
- Graph-based semi-supervised learning is just a mask of all of the above combined.
