- Large Deviation Theory with S.R.S. Varadhan
- For today's work: Donsker's theorem, i.e. Functional Central Limit Theorems.

Peter W. Glynn (Applied Mathematician)

- Professor at Stanford, Operations Research
- Former chair of Department of Management Science and Engineering at Stanford.
- For today's work: Diffusion approximations for complicated stochastic processes.

Nonconvex Optimization

We aim to solve the following nonconvex optimization problem:

$$\min_{\mathbf{x}} F(\mathbf{x}) = \mathbb{E}\left[f(\mathbf{x};\xi)\right]$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ - 三 - のへで

where ξ is sampled from some distribution \mathcal{D} .

Nonconvex Optimization

We aim to solve the following nonconvex optimization problem:

$$\min_{\mathbf{x}} F(\mathbf{x}) = \mathbb{E}\left[f(\mathbf{x};\xi)\right]$$

where ξ is sampled from some distribution \mathcal{D} .

Stochastic Gradient Descent and its Variants We evaluate the noisy gradient and update by

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

where η is step-size/learning rate, and noise ξ_k independent of the sigma algebra generated up to $\mathbf{x}^{(k-1)}$.

Nonconvex Optimization

We aim to solve the following nonconvex optimization problem:

$$\min_{\mathbf{x}} F(\mathbf{x}) = \mathbb{E}\left[f(\mathbf{x};\xi)\right]$$

where ξ is sampled from some distribution \mathcal{D} .

Stochastic Gradient Descent and its Variants We evaluate the noisy gradient and update by

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

where η is step-size/learning rate, and noise ξ_k independent of the sigma algebra generated up to $\mathbf{x}^{(k-1)}$.

Notice that $\mathbf{x}^{(k)}$ forms a discrete-time Markov process with laws determined by ξ (and hence time-homogeneous).

Diffusion Approximations

Rescaled Random Walk

Consider $X_1, X_2, ...$ i.i.d. centered random variables with unit variance. Write $S_n = \sum_{i=1}^n X_i$.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Consider $X_1, X_2, ...$ i.i.d. centered random variables with unit variance. Write $S_n = \sum_{i=1}^n X_i$. Then

$$W^{(n)}(t) \coloneqq \frac{S_{[nt]}}{\sqrt{n}} \stackrel{d}{\to} W(t) \sim \mathcal{N}(0, t) \,.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

$$W^{(n)}(t) \coloneqq \frac{S_{[nt]}}{\sqrt{n}} \stackrel{d}{\to} W(t) \sim \mathcal{N}(0, t) \,.$$

(日) (日) (日) (日) (日) (日) (日)

Note that $W^{(n)}(1) \xrightarrow{d} \mathcal{N}(0,1)$ by classical CLT.

Consider $X_1, X_2, ...$ i.i.d. centered random variables with unit variance. Write $S_n = \sum_{i=1}^n X_i$. Then

$$W^{(n)}(t) \coloneqq \frac{S_{\lfloor nt \rfloor}}{\sqrt{n}} \stackrel{d}{\to} W(t) \sim \mathcal{N}(0, t) \,.$$

Note that $W^{(n)}(1) \xrightarrow{d} \mathcal{N}(0,1)$ by classical CLT.

Donsker's Theorem, Functional CLT

Consider $X_1, X_2, ...$ i.i.d with distribution F. Define the empirical distribution function $F_n(x) = \frac{1}{n} \sum_{i=1}^n \mathbf{1}_{X_i < x}$.

(日) (日) (日) (日) (日) (日) (日)

Consider $X_1, X_2, ...$ i.i.d. centered random variables with unit variance. Write $S_n = \sum_{i=1}^n X_i$. Then

$$W^{(n)}(t) \coloneqq \frac{S_{\lfloor nt \rfloor}}{\sqrt{n}} \stackrel{d}{\to} W(t) \sim \mathcal{N}(0, t) \,.$$

Note that $W^{(n)}(1) \xrightarrow{d} \mathcal{N}(0,1)$ by classical CLT.

Donsker's Theorem, Functional CLT

Consider $X_1, X_2, ...$ i.i.d with distribution F. Define the empirical distribution function $F_n(x) = \frac{1}{n} \sum_{i=1}^n \mathbf{1}_{X_i < x}$. Then

$$G_{n}(x) = \sqrt{n} \left(F_{n}(x) - F(x) \right) \stackrel{d}{\rightarrow} \mathcal{N}(0, \Sigma_{t})$$

where the covariance Σ_t

$$\operatorname{Cov}\left(G(s),G(t)\right) = \min\left\{F(s),F(t)\right\} - F(s)F(t).$$

 Discrete processes, properly scaled, can be approximated by Brownian motions weakly.

 Discrete processes, properly scaled, can be approximated by Brownian motions weakly. For example, the rescaled random walk (mean μ and covariance Σ in general) satisfies

$$S_{[nt]} \stackrel{d}{\approx} \mu nt + \sqrt{n\Sigma}B(t)$$

 Continuous mapping principle applies (e.g. h(X_t) where h is continuous).

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

 Discrete processes, properly scaled, can be approximated by Brownian motions weakly. For example, the rescaled random walk (mean μ and covariance Σ in general) satisfies

$$S_{[nt]} \stackrel{d}{\approx} \mu nt + \sqrt{n\Sigma}B(t)$$

- Continuous mapping principle applies (e.g. h(X_t) where h is continuous).
- Identify scaled means and covariances to derive an SDE for the approximant.

Pros and Cons

Why approximations?

Diffusion is easier to study than discrete processes.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Why approximations?

- Diffusion is easier to study than discrete processes.
- One can prove concentration results to learn about convergence rates, e.g. Komlós–Major–Tusnády approximation [6] that improves Donsker's theorem.

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Why approximations?

- Diffusion is easier to study than discrete processes.
- One can prove concentration results to learn about convergence rates, e.g. Komlós–Major–Tusnády approximation [6] that improves Donsker's theorem.
- For variants of SGD, only the functional form changes. The approximation approach is general. (see Momentum SGD as another example [5]).

$$\mathbf{X}^{(k)} = \mathbf{X}^{(k-1)} - \eta \nabla f\left(\mathbf{X}^{(k-1)}; \xi_k\right) + \mu\left(\mathbf{X}^{(k-1)} - \mathbf{X}^{(k-2)}\right)$$

(This gives rise to an Ornstein-Uhlenbeck process which has a closed form analytical solution.)

Questions to address

Convergence, rate of convergence, accuracy (in what sense?)

Back to SGD

Diffusion Approximations of SGD

$$\min_{\mathbf{x}} F(\mathbf{x}) = \mathbb{E} \left[f(\mathbf{x}; \xi) \right]$$
$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f \left(\mathbf{x}^{(k-1)}; \xi_k \right)$$

[3] showed that the discrete Markov process $\mathbf{x}^{(k)}$ can be approximated (in the sense of weak accuracy) by the scaled solution $\mathbf{X}(k\eta)$ to the SDE (for finite time [0, T])

$$d\mathbf{X}(s) = b(\mathbf{X}(s)) ds + \sqrt{\eta} \mathbf{S}(\mathbf{X}(s)) d\mathbf{B}(s), \quad \mathbf{X}(0) = \mathbf{x}^{(0)}$$
$$b(\mathbf{x}) = -\nabla F(\mathbf{x}) - \frac{1}{4} \eta \nabla |\nabla F(\mathbf{x})|^{2}$$
$$\mathbf{S}(\mathbf{x}) = \sqrt{\operatorname{var}(\nabla f(\mathbf{x};\xi))}$$

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

1. Work with error terms, i.e. normalize the variable by

$$\mathbf{u}_{\eta}^{(k)} = \frac{\mathbf{x}_{\eta}^{(k)} - \mathbf{x}^{*}}{\sqrt{\eta}}, \text{ as } \operatorname{Var}\left(\mathbf{x}_{\lfloor \frac{1}{\eta} \rfloor} - \mathbf{x}^{*}\right) = O(\eta).$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

1. Work with error terms, i.e. normalize the variable by

$$\mathbf{u}_{\eta}^{(k)} = \frac{\mathbf{x}_{\eta}^{(k)} - \mathbf{x}^{*}}{\sqrt{\eta}}, \text{ as } \operatorname{Var}\left(\mathbf{x}_{\lfloor \frac{1}{\eta} \rfloor} - \mathbf{x}^{*}\right) = O(\eta).$$

$$\gamma_{\eta}^{(k)} = \nabla F\left(\mathbf{x}_{\eta}^{(k)}\right) - \nabla f\left(\mathbf{x}_{\eta}^{(k)}, \xi_{k}\right)$$

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

1. Work with error terms, i.e. normalize the variable by

$$\mathbf{u}_{\eta}^{(k)} = \frac{\mathbf{x}_{\eta}^{(k)} - \mathbf{x}^{*}}{\sqrt{\eta}}, \text{ as } \operatorname{Var}\left(\mathbf{x}_{\lfloor \frac{1}{\eta} \rfloor} - \mathbf{x}^{*}\right) = O(\eta).$$

2. Get the true gradient ∇F into the equation to form a martingale difference sequence

$$\gamma_{\eta}^{(k)} = \nabla F\left(\mathbf{x}_{\eta}^{(k)}\right) - \nabla f\left(\mathbf{x}_{\eta}^{(k)}, \xi_{k}\right)$$

3. Identify the variance of all noises in the current setting.

$$\mathbf{x}^{(k)} = \mathbf{x}^{(k-1)} - \eta \nabla f\left(\mathbf{x}^{(k-1)}; \xi_k\right)$$

1. Work with error terms, i.e. normalize the variable by

$$\mathbf{u}_{\eta}^{(k)} = \frac{\mathbf{x}_{\eta}^{(k)} - \mathbf{x}^{*}}{\sqrt{\eta}}, \text{ as } \operatorname{Var}\left(\mathbf{x}_{\lfloor \frac{1}{\eta} \rfloor} - \mathbf{x}^{*}\right) = O(\eta).$$

2. Get the true gradient ∇F into the equation to form a martingale difference sequence

$$\gamma_{\eta}^{(k)} = \nabla F\left(\mathbf{x}_{\eta}^{(k)}\right) - \nabla f\left(\mathbf{x}_{\eta}^{(k)}, \xi_{k}\right)$$

Identify the variance of all noises in the current setting.
Take η → 0 for the discretization scheme.
